Interoperability across systems, across the enterprise, across the world

Enterprise Health is incredibly interoperable. The solution interfaces with a wide range of data sources from corporate HR and email applications, medical devices, laboratories, insurance carriers, external providers and any other data source you can imagine.

By enabling data exchange across the enterprise, Enterprise Health all but eliminates data silos and reduces data entry and errors. Employee health data is managed in a single solution to make it accessible, actionable and reportable — giving organizations the information they need to improve health, wellness, productivity and efficiency.
